## 42 **1 Introduction**

43 The goal of this document is to describe the architecture and interfaces of the PEPPOL Directory (PD;  
44 formerly known as PEPPOL Yellow Pages) project. The goal of the PD project is to create a publicly  
45 available, searchable list of all PEPPOL participants with their respective metadata like company  
46 name, country code, etc. (for details see chapter 4.1). The PD is not meant to replace existing PEPPOL  
47 components but to be an aggregator for data that is contained in existing PEPPOL SMPs.

48 An additional singleton service is added to the PEPPOL infrastructure: the so called **PD Server**. It is  
49 filled with electronic **Business Cards** of the PEPPOL participants on a voluntary basis<sup>2</sup> meaning that  
50 SMP providers can (but are not forced to) publish their client's metadata in the PD. The data is stored  
51 in correlation with the SMP entry of the respective participant (aka service group). Details are  
52 described in chapter 4.2.

53 This document describes the architecture of the PD server, the interfaces to and from it as well as the  
54 data format for the Business Cards (see chapter 4) within the SMP. This document concludes with a  
55 technical proposal on how the PD Server could be implemented.

## 56 **2 Why PEPPOL Directory?**

57 Due to variations between countries and markets, there are no shared models on how to know the  
58 PEPPOL Participant ID (PPID) of the sender, further enforced by the lack of open national business  
59 registries. Knowing each other in domains of limited size, for example e-CODEX project in e-Justice, is  
60 easy, however in domains like PEPPOL having potentially millions of organizations it is impossible.

61 Trying to solve the problem of finding each other, PEPPOL Directory (PD) is introduced, a central  
62 service to query based on given metadata. Querying may be part of a manual or automated process  
63 before performing lookup in SML (Service Metadata Locator) and SMP (Service Metadata Publisher).  
64 PD contains indexed PEPPOL Directory Business Cards (BC) containing metadata related to a given  
65 PPID. The lack of a PEPPOL Directory is a constraint to wider scale adoption of PEPPOL by small and  
66 medium sized enterprises.

### 67 **2.1 Use Cases**

68 The PEPPOL Directory is intended to support business cases that are concerned with finding PEPPOL  
69 participants registered on the PEPPOL network in order to start exchanging business documents with  
70 them. Some of the possible business cases are identified below.

#### 71 **2.1.1 New PEPPOL BIS support - Matching**

72 An organization that has recently become a PEPPOL participant to exchange a particular PEPPOL BIS,  
73 as a Customer or a Supplier, will want to find who of their trading partners are capable of exchanging  
74 the same BIS documents in the opposing role.

---

<sup>2</sup> National PEPPOL authorities however may force participants to show up in the PD.

75 As example an organization that is starting to send invoices may want to know which of their  
76 customers can receive them and an organization that is starting to receive invoices will want to know  
77 which of their suppliers can send them.

### 78 **2.1.2 Monitoring new PEPPOL users - Alerting**

79 An organization that is using PEPPOL to exchange one or more PEPPOL BIS may want to monitor  
80 when more of their trading partners become PEPPOL participants and consequently to automate  
81 their trading relations with them by using PEPPOL.

## 82 **2.2 Planned key functions of PEPPOL Directory**

83 The following key functions are planned for the PEPPOL Directory and will be implemented through  
84 different releases of the Directory. These features are intended to support the business use cases  
85 described in the previous chapter.

### 86 **2.2.1 Free text search**

87 A free text search allows the Directory user to enter a text string into an online form and get a list of  
88 result for all listings in the Directory where that string appears. As an example if the user enters the  
89 word "Acme" he will get a list of all participants who's name contains the word "Acme" as well as  
90 participants where the word "Acme" appears in other elements of the Business Card.

91 The user can browse the list to find the PEPPOL participant he is looking for and then click on his  
92 choice to see the full details.

### 93 **2.2.2 Identifier search**

94 The directory specification supports the use of qualified identifiers for the search. The objective is to  
95 enable single match searches where the user submits a query on whether there exists a user with a  
96 particular identifier and BIS capabilities. This enables searching by VAT, legal identifiers and others  
97 parameters that are commonly known but may differ from the PEPPOL end point identifiers. As an  
98 example a user may want to find the end point identifier for a customer who has a particular VAT  
99 identifier. By restricting the search to a particular capability he can use the query to monitor when  
100 that customer starts to support the given documents.

### 101 **2.2.3 API connection**

102 The PEPPOL Directory will also enable Directory users to let their systems connect automatically  
103 instead of manually browsing through a web interface. This supports automated searches that can be  
104 integrated into the sending process.

105 A drawback to be considered is that the publication of the Business Cards in the PEPPOL Directory  
106 happens on a voluntary basis.

## 107 **2.3 Considerations**

108 The following considerations that may influence the ongoing development of the PEPPOL Directory  
109 have been identified but may require additional analysis.

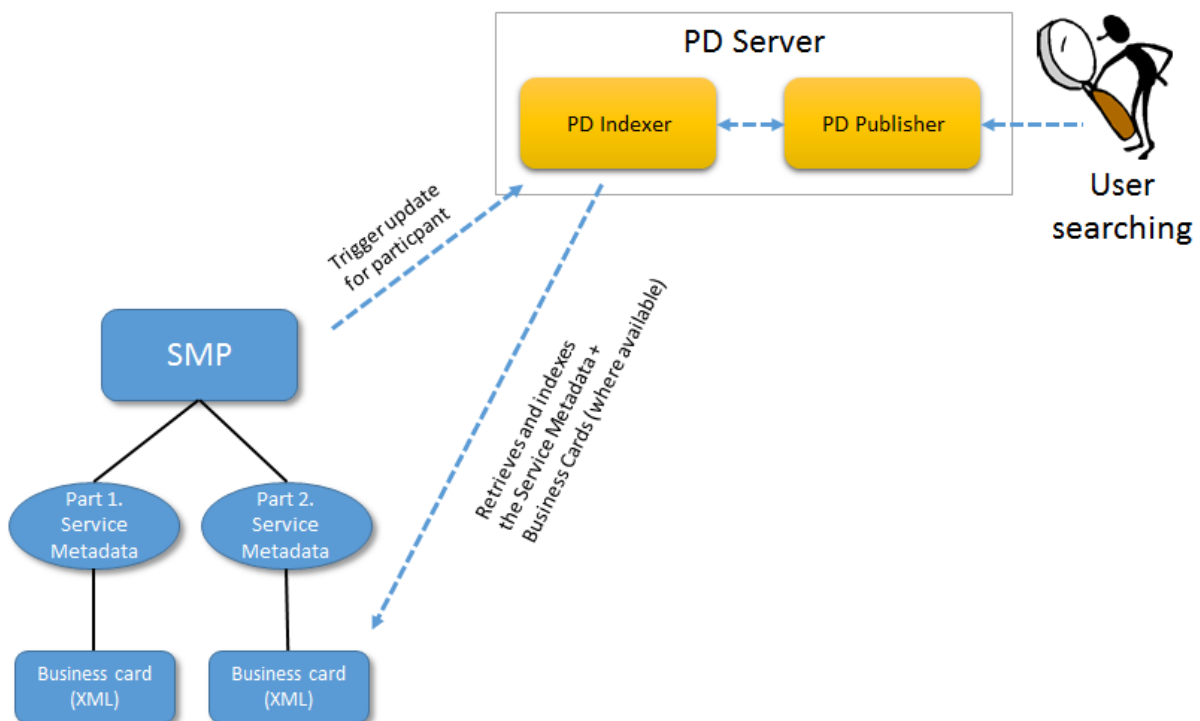

### 110 2.3.1 Searching for senders

111 The current architecture of the PEPPOL network does not require PEPPOL Participants who are only  
 112 sending documents to be registered in the SMP's and consequently they are not in the SML. This  
 113 limits the capability of the PEPPOL Directory to include these PEPPOL participants in search results.  
 114 This relates to other issues that are currently being addressed in other PEPPOL initiatives. A potential  
 115 change in the PEPPOL policy that requires registration of senders would benefit the PEPPOL Directory  
 116 without requiring additional changes to the PD.

117 Alternatively sending only participants may be registered to an SMP with an empty service group  
 118 which allows them to publish Business Cards for the PEPPOL Directory as well.

## 119 3 PD Server architecture

120 This section describes the overall architecture of the PD Server. It logically consists of two major  
 121 parts: a *PD Indexer* which is responsible for creating, updating, deleting and indexing the Business  
 122 Card data and the *PD Publisher* which is the public web frontend to the PD for both humans and  
 123 machines.

124

125

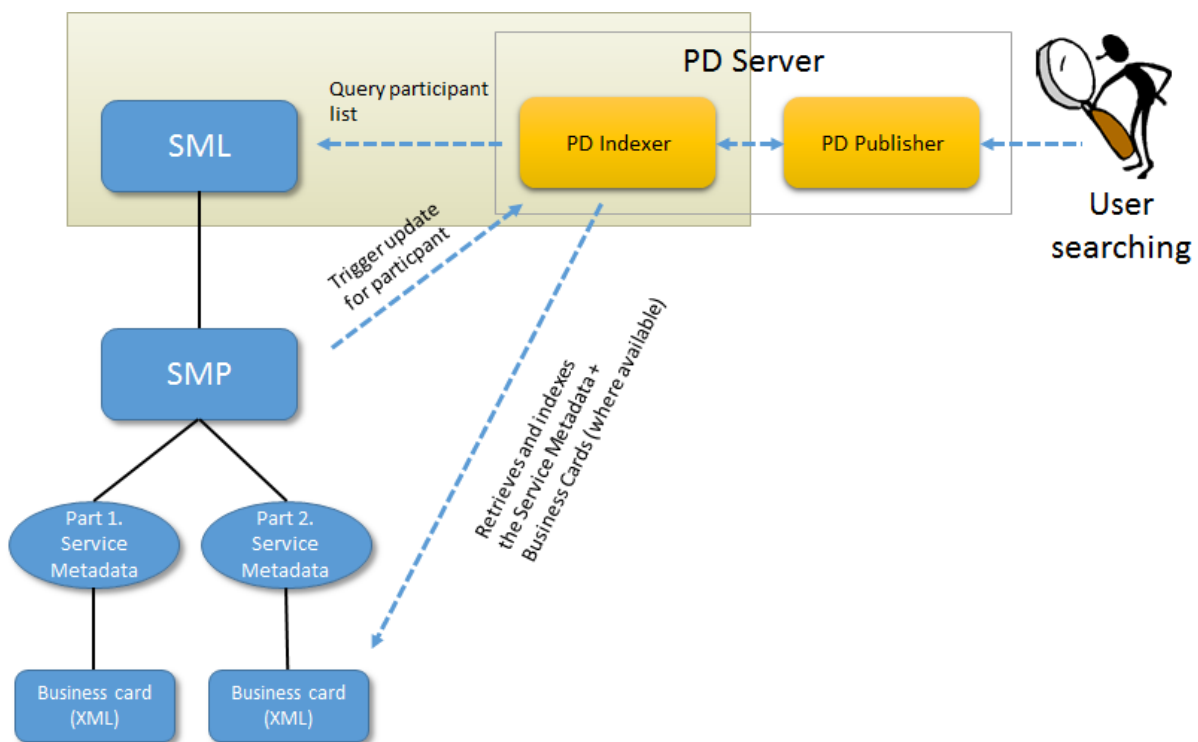

Figure 1: PD big picture without SML

126 The above big picture outlines the information flow. If a participant's business card is added to,  
 127 updated to or deleted from an SMP, the SMP MAY trigger an update to the *PD Indexer* (see arrow  
 128 from SMP to the *PD Indexer* in the figure) even if the Business Card contained in the SMP is empty. If  
 129 data is to be added or updated on the PD, the *PD Indexer* will retrieve the complete Business Card

130 from the respective SMP and index it for searchability (see arrow from PD Indexer to *Business card* in  
131 the figure).

132 If a user wants to know whether a certain company is registered in the PEPPOL network he opens the  
133 web site of the *PD Publisher*, types the search term (e.g. the company name) and a list of potential  
134 hits (including the PEPPOL participant identifier and the supported PEPPOL document types) shows  
135 up. Additionally to the human interface a REST interface for automatic searching is offered. The *PD*  
136 *Publisher* retrieves all relevant information directly from the *PD Indexer* so that no interaction with  
137 the concerned SMPs is necessary.

138 An extension to the *PD Indexer* is the direct connection to the SML to retrieve a list of **all** registered  
139 PEPPOL participants. In this case the *PD Indexer* will query the SML regularly (e.g. once a week) for a  
140 complete participant list and queries the respective SMPs independent of the SMP provided update  
141 status.

142

143

Figure 2: PD big picture with SML

144 As shown in the previous figure the overall architecture is only extended to interconnect with the  
145 SML and no other changes are necessary. The SML already offers an interface to retrieve a list of all  
146 registered PEPPOL participants and is therefore prepared to be interconnected with the PD.

147 Early benchmarks on the SML test machine (being slower than the production machine) showed that  
148 a list with 100.000 entries can be created in 16 seconds and 150.000 entries took 34 seconds. By end  
149 of 2015 approx. 40.000 entries were in the production database.

## 150 4 Business card

### 151 4.1 Data format

152 This section describes the layout of the business card data that is stored in an SMP. Because the  
153 scope of a single PEPPOL participant identifier within an SMP can be very broad, the data format  
154 must be capable of handling information for more than one business entity in a structured way.  
155 Sometimes a PEPPOL participant may even link to different entities in different countries.

156 Existing formats like vCard, xCard or the UBL 2.1 Party type were not considered because they are  
157 either not XML or too complex to interpret fully. Instead a new minimal XML-based format is created  
158 because PEPPOL participant identifiers are used very differently it was decided to use a very flexible  
159 scheme that can represent multiple business entities at once.

160 The format defines a single business card consisting of the following fields:

- 161 • PEPPOL participant ID
  - 162 ○ Description: PEPPOL participant identifier corresponding to a service group hosted
  - 163 on the same SMP
  - 164 ○ Multiplicity: 1..1 (mandatory)
- 165 • PEPPOL document type ID
  - 166 ○ Descriptions: all PEPPOL document type identifiers as indicated by the default SMP
  - 167 service group query.
  - 168 ○ Multiplicity: 0..n (optional but potentially many)
- 169 • Business entity
  - 170 ○ Description: a business entity that can be reached via the provided PEPPOL
  - 171 participant ID
  - 172 ○ Multiplicity: 0..n (optional but potentially many)

173 Each business entity consists of the following fields:

- 174 • Entity name
  - 175 ○ Description: the company name or the name of the governmental entity
  - 176 ○ Multiplicity: 1..1 (mandatory)
- 177 • Country code
  - 178 ○ Description: the country code in ISO 3166-2 format (e.g. "AT" for Austria)
  - 179 ○ Multiplicity: 1..1 (mandatory)
- 180 • Geographic information
  - 181 ○ Description: describes the location or region of the entity that is usually used to
  - 182 identify the entity. This may be an address, a state name etc.
  - 183 ○ Multiplicity: 0..1 (optional)
- 184 • Identifier
  - 185 ○ Description: additional (non-PEPPOL) identifiers of the entity that are not part of the
  - 186 PEPPOL participant identifier. It consists of a type and a value. This can e.g. be a

- 187 national VAT identification number; a national company register number etc. The  
 188 following identifier types (case insensitive) must at least be supported by the  
 189 Directory:
- 190     ▪ “vat” – VAT identification number including the national prefix
  - 191     ▪ “orgnr” – the national organisation number
  - 192     ▪ “gln” – Global Location Number (GLN)
  - 193     ▪ “duns” – DUNS number
  - 194     ○ Multiplicity: 0..n (optional but potentially many)
  - 195     • Registration date
    - 196         ○ Description: the date when the participant joined the PEPPOL network
    - 197         ○ Multiplicity: 0..1 (optional)

198 The XML Schema describing the layout of the Business Card can be found in chapter 7 of this  
 199 document. To support future updates of this Business Card scheme the XML root element  
 200 (`BusinessCard`) has an XML namespace URI that allows for easy versioning of the contained data.  
 201 Version 1 of the XML schema for the business card uses the XML namespace URI  
 202 <http://www.peppol.eu/schema/pd/businesscard/20161123/>.

203 A non-normative example Business Card with a single entity looks like this:

```

204 <BusinessCard
205   xmlns="http://www.peppol.eu/schema/pd/businesscard/20161123/">
206   <ParticipantIdentifier
207     scheme="iso6523-actorid-upis">0088:example</ParticipantIdentifier>
208   <BusinessEntity registrationDate="2010-07-06">
209     <Name>ACME Inc.</Name>
210     <CountryCode>AT</CountryCode>
211     <GeographicalInformation>ACME street 123</GeographicalInformation>
212     <Identifier scheme="VAT">ATU12345678</Identifier>
213     <Identifier scheme="OrgNr">hjd7as9ds</Identifier>
214   </BusinessEntity>
215 </BusinessCard>
  
```

## 216 4.2 SMP impacts

217 This chapter describes the constraints for storing Business Cards in an SMP and how to access the  
 218 Business Cards from the outside.<sup>3</sup>

### 219 4.2.1 Storage

220 This section describes how and where Business Cards are to be stored in an SMP. The SMP  
 221 differentiates between service groups and service registrations. A service group is basically the  
 222 PEPPOL participant identifier whereas a service registration is the combination of a participant  
 223 identifier, a document type, a process identifier, a transport protocol and an AP endpoint URL (plus  
 224 some additional information).

---

<sup>3</sup> phoss SMP and IBM SMP have already implemented support for the BusinessCard API in their solutions.

225 Each Business Card must be stored in relation to a single SMP service group. There are no predefined  
226 rules how this is to be achieved as the data storage mechanisms of an SMP server are quite different  
227 in practice. The only binding rules are:

- 228 1. An SMP MUST NOT provide Business Cards for service groups not owned by this SMP.
- 229 2. Each service group MAY have zero or one associated Business Card.
- 230 3. The link between the Service Group and the Business Card MUST be the PEPPOL participant  
231 ID.

232 Originally it was considered to store the Business Card information in the `Extension` element of an  
233 SMP Service Group. The positive aspects of this solution are that the data model of existing SMPs  
234 does not need to be altered and that no new APIs for the SMP must be provided. The negative  
235 aspects of this solution are that the network traffic for non-PD queries would heavily increase and  
236 the general performance of SMPs might be downgraded and that non-relevant information would be  
237 returned in regular Service Group queries. An additional problem with this solution is that the  
238 PEPPOL SMP specification is lacking support for multiple extensions in a single service group which in  
239 turn would require an additional non-standard “extension container” to maintain extensibility. OASIS  
240 BDXR SMP CS03 adds supported for multiple extensions.

#### 241 4.2.2 Public REST interface

242 To retrieve the Business Cards from an SMP server a new REST interface is introduced. This interface  
243 must be provided by all SMP servers that want to serve Business Card data for the PD. REST was  
244 chosen because the existing SMP interfaces are already REST based and therefore no new technology  
245 is introduced.

##### 246 4.2.2.1 Retrieve Business Card interface

247 REST request: `GET /businesscard/{participantID}`

248 Note: `{participantID}` is the placeholder for the effective PEPPOL participant identifier in the  
249 URL encoding form

250 REST response: the XML representation of the business card (according to the XSD specified in  
251 chapter 7) preferably in UTF-8 encoding using MIME type `application/xml`.

252 REST response code:

- 253 ● HTTP 200 (OK) – everything was ok. A response body is send back.
- 254 ● HTTP 404 (Not found) – no Business card was found for the provided participant ID.
- 255 ● HTTP 500 (Internal server error) – something internally went wrong. Response body contains  
256 the details in plain text.

257 Non-normative example to query the business card for PEPPOL participant `9915:test` on the SMP  
258 server running at `http://smp.example.org`:

259 `http://smp.example.org/businesscard/iso6523-actorid-upis%3A%3A9915%3Atest`

---

260 The response may look like the example provided in section 4.1.

261 Note: using PEPPOL participants directly in URLs may impose problems. It must be ensured that the  
262 colon character (":") is escaped as %3A in the URL.

263

264 Note: this interface must also work with the computed "B-....edelivery.tech.ec.europa.eu" URLs.

265

266 Note: as a future extension, the response of the SMP may be signed with the PEPPOL SMP certificate.

## 267 5 PD Indexer

268 This chapter describes the technical details of the *PD Indexer*. It describes the data elements that  
269 must be passed to the *PD Indexer* so that Business Cards can be created, updated, deleted or  
270 retrieved. This is a REST interface, because the SMP server (that will trigger this interface) is also a  
271 REST server and therefore the technology is well known and supported.

272 All REST interface URLs contain a version number so that it will be easy to provide updated interfaces  
273 in the future without breaking the existing ones.

### 274 5.1 Authentication and authorization

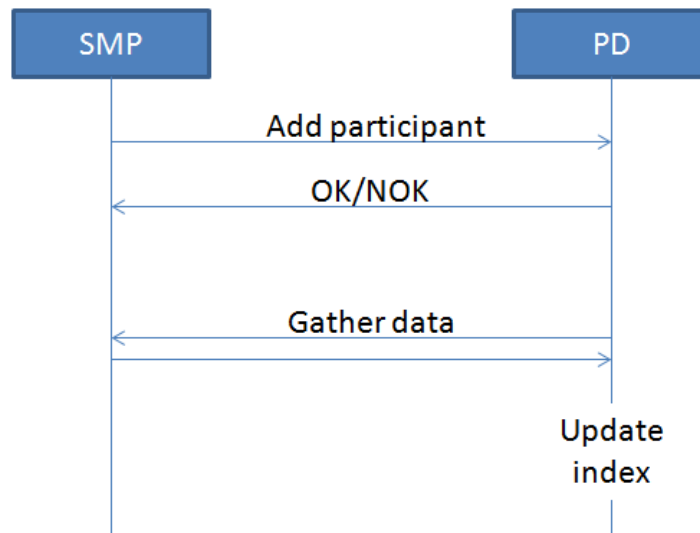

275 Note: this section is only applicable, if the *PD Indexer* runs on a server that offers secure HTTP  
276 connections (https).

277 For security reasons, only legitimate PEPPOL SMPs are allowed to request modifications in the *PD*  
278 *Indexer*. To ensure this *all* HTTP calls to the *PD Indexer* interface must provide a client X.509  
279 certificate. This is the same technology that is already used in the SMP to SML communication and  
280 should therefore be implementable in a quick and easy way. Requests to the *PD Indexer* without a  
281 client certificate will result in an error.

282 The provided client certificate must be the PEPPOL SMP certificate as used for the communication  
283 with the SML.

### 284 5.2 Adding a participant

285 For adding a participant, only the participant identifier must be passed to the *PD Indexer*. The  
286 Business Card is read directly from the respective SMP (determined via DNS lookup) and is not  
287 passed in this call. This allows the *PD Indexer* to build a queue of items to be updated in an optimized  
288 way and also avoids overwriting data of PEPPOL participants that are owned by different SMPs.

289

290

Figure 3: Add participant workflow

291 REST request: `PUT /indexer/1.0/`292 Request body: `{participantID}`

293 Note: {participantID} is the placeholder for the effective PEPPOL participant identifier in URL encoded  
 294 form

295 Example request:

- 296 • URL: `PUT /indexer/1.0/`
- 297 • Body: `iso6523-actorid-upis%3A%3A0088%3Agln1234`

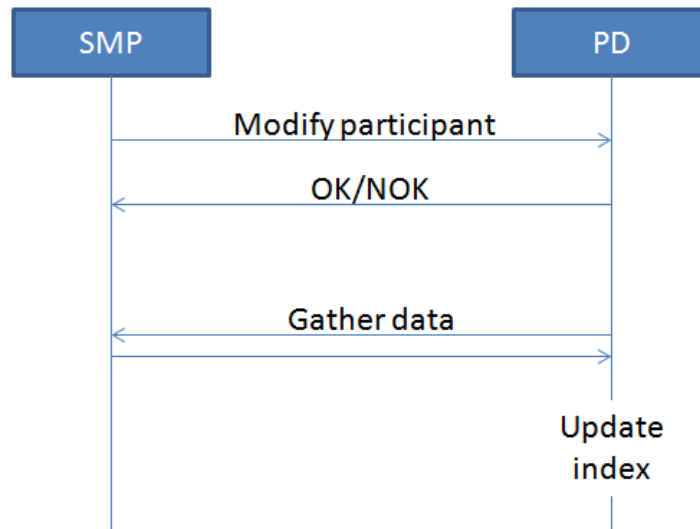

298 REST response code:

- 299 • HTTP 204 (OK, No content) – everything was ok. No response body is send back.
- 300 • HTTP 403 (Forbidden) – no client certificate or an invalid client certificate provided
- 301 • HTTP 500 (Internal server error) – something internally went wrong. Response body contains  
 302 the details in plain text.

303 Note: This requires the DNS entry of the added PEPPOL participant already being available publicly to  
 304 resolve the owning SMP. Therefore an SMP MUST call the PD after the registration at the SML. The  
 305 *PD Indexer* will handle added participants gracefully if the respective DNS entry is not yet present  
 306 and will retry at a later point in time. If a new participant DNS entry is not present within 24 hours  
 307 of the original indexing request, this particular request is discarded and therefore no indexing  
 308 takes place. If previous indexed information of that participant is present (if it is an updating call)  
 309 they are left unchanged.

### 310 5.3 Modifying an existing participant

311 If the business card of an existing participant is modified the *PD Indexer* must be informed about the  
 312 change. The API and the constraints are identical to “Adding a participant” (see chapter 5.2).

313

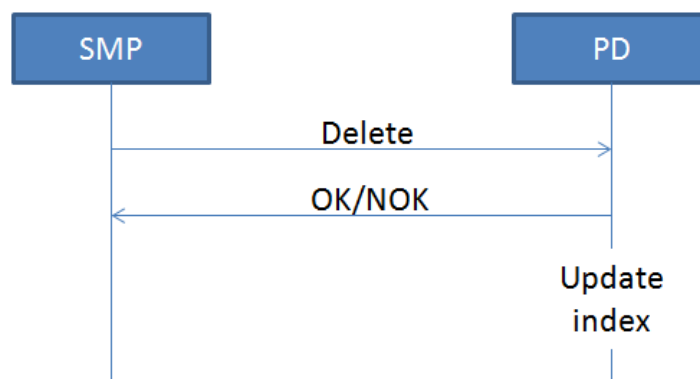

314

Figure 4: Modify participant workflow

315 Note: there is no possibility to identify whether the participant was added or updated by the  
 316 response. To check for existence, use the GET operation defined below.

### 317 5.4 Deletion of a participant

318 When a service group in the SMP is about to be deleted (either because the participant leaves the  
 319 PEPPOL network or because an SMP migration takes place), the *PD Indexer* must be notified. To  
 320 delete participant information in the *PD Indexer* it is suitable to provide only the respective PEPPOL  
 321 identifier.

322

323

Figure 5: Delete participant workflow

324 REST request: `DELETE /indexer/1.0/{participantID}`

325 Note: {participantID} is the placeholder for the effective PEPPOL participant identifier in URL encoded  
326 form

327 Example request:

328 • `DELETE /indexer/1.0/iso6523-actorid-upis%3A%3A0088%3AglN1234`

329 Note: using PEPPOL participants directly in URLs may impose problems. So please ensure that the  
330 colon character (":") is escaped as %3A in the URL.

331 REST response code:

- 332 • HTTP 204 (OK, No content) – everything was ok. No response body is send back.
- 333 • HTTP 403 (Forbidden) – no client certificate or an invalid client certificate provided
- 334 • HTTP 500 (Internal server error) – something internally went wrong. Response body contains  
335 the details in plain text.

336 Note: if a participant is moved from SMP to another it must first be deleted by the old SMP and then  
337 re-created by the new SMP.

338  
339 Note: the delete operation may impose a security problem because one SMP can delete the  
340 information of a participant created by a different SMP. Therefore the deletion does not directly  
341 delete the information in the index but only marks the respective records internally as “deleted”  
342 so that the data can be restored in case of a misuse.

## 343 5.5 Existence check of a participant

344 Checking whether a business card of a PEPPOL participant is present in the *PD Indexer* can be  
345 performed via the following interface:

346 REST request: `GET /indexer/1.0/{participantID}`

347 Note: {participantID} is the placeholder for the effective PEPPOL participant identifier

348 Example request:

349 • `GET /indexer/1.0/iso6523-actorid-upis%3A%3A0088%3AglN1234`

350 Note: using PEPPOL participants directly in URLs may impose problems. So please ensure that the  
351 colon character (":") is escaped as %3A in the URL.

352 REST response code:

- 353 • HTTP 204 (OK, No content) – Yes, the participant is already in the *PD Indexer*.
  - 354 • HTTP 403 (Forbidden) – no client certificate or an invalid client certificate provided
  - 355 • HTTP 404 (Not found) –the participant is not in the *PD Indexer*.
-

- 356       • HTTP 500 (Internal server error) – something internally went wrong. Response body contains  
357       the details in plain text.

358       Note: because of the internal asynchronous processing, it might take some time after an index  
359       request until the participant is available in search results. See chapter 5.7 for more details.

## 360   **5.6 Auditing and Logging**

361   All successful calls to the *PD Indexer* (create/update/delete/get) are logged together with the  
362   timestamp, the source IP address and some information from the provided certificate (country,  
363   subject name and serial number) to ensure traceability of the performed actions.

## 364   **5.7 Internal processing of the data**

365   Internally the Indexer keeps a FIFO work queue that is processed asynchronously. All new indexing  
366   requests (create/update/delete) are put into that queue and wait for their serial processing to avoid  
367   overloading a single SMP with queries. That's why deletion (see chapter 5.4) may not trigger an  
368   immediate return code like "not found" because the result is not known synchronously.

369   If the data retrieval from the SMP fails (for whatever reason) the work item is put into a special "retry  
370   queue" and the data retrieval is retried some time later (suggested duration until retry is 5 minutes –  
371   must be configurable). If an entry cannot be indexed after a certain period of time (suggested period  
372   is 24 hours – must also be configurable), it is moved to a "dead work item queue". In case of a  
373   permanent failure manual intervention is necessary. E.g. the PD administrator may re-trigger the  
374   work item manually or choose to drop it completely.

375   The asynchronous processing may impose problems when trying to check for the existence of a  
376   certain PEPPOL participant identifier in the index. This check will only return success if the item was  
377   already processed by the worker queue but not if it is still in the work queue.

## 378   **5.8 Internal data structure**

379   The internal data structure of the *PD Indexer* is slightly different from the Business Card entities  
380   defined in chapter 4.1. Besides the Business Card content the following data elements should also be  
381   stored:

- 382       • All supported PEPPOL document type identifiers as listed by the PEPPOL service group  
383       interface. Therefore a separate SMP query on the ServiceGroup must be performed and the  
384       document types must be extracted.
- 385       • The unique identifier taken from the client certificate that triggered the indexing of the  
386       document (the "requestor"). This can e.g. consist of the certificates subject name, serial  
387       number and country code.
- 388       • The date and time when the Business Card was last indexed.

## 389 6 PD Publisher

390 This section describes the components of the *PD Publisher*. It consists of a machine-to-machine  
 391 search interface as well as a search interface for humans as well as a list of registered PEPPOL  
 392 participants for download. Additional features can be integrated into the Publisher after the initial  
 393 version.

### 394 6.1 Search interface

395 This section only describes the machine-to-machine search interface. It uses REST as the protocol and  
 396 responds (at least) with XML data<sup>4</sup>.

#### 397 6.1.1 Request

398 The relative base URL of the REST search service is `/search/1.0/[format]` which is then  
 399 followed by a list of query parameters as outlined below. The `[format]` placeholder in the request  
 400 API denotes the desired response format. Initially only `xml` format (for XML output) will be used but  
 401 other formats (like JSON) might be added as a future extension. All search REST requests are HTTP  
 402 GET requests. Other HTTP methods like POST, PUT etc. are not supported.

403 The search routines should use the following text matching algorithms:

- 404 • *Exact match*: the search term and the indexed values must be completely equal, including  
 405 case sensitivity.
- 406 • *Partial match*: the search term must be equal or fully contained in the indexed value in a case  
 407 insensitive way (e.g. searching for “tici” or “TICI” in the indexed value “participant” will be a  
 408 match)
- 409 • *Starts with match*: a special version of the partial match that requires the indexed value to  
 410 begin with the search term in a case insensitive way (e.g. search for “part” or “PART” will  
 411 match “participant” but “art” won’t match “participant”)

Parameter name	Explanation
<b>q</b>	General purpose query term. This term is searched in all fields with the matching rules of the respective fields. Multiple search terms can be provided separated by a whitespace character.
<b>participant</b>	Searches for <i>exact matches</i> in the <i>PEPPOL participant identifier</i> field (the identifier scheme must be part of the value)
<b>name</b>	Searches for <i>partial matches</i> in the <i>entity name</i> field. Multiple search terms can be provided separated by a whitespace character. Only search terms consisting of at least 3 characters are used for search.
<b>country</b>	Searches for <i>exact matches</i> in the <i>country code</i> field
<b>geoinfo</b>	Searches for <i>partial matches</i> in the <i>geographic information</i> field. Multiple search terms can be provided separated by a whitespace character. Only search terms consisting of at least 3 characters are used for search.
<b>identifier</b>	Searches for <i>exact matches</i> in the <i>identifier</i> fields (only the value, not the type)

<sup>4</sup> Upon request additional data formats like JSON can be added

<b>regdate</b>	Searches for matches in the <i>registration date</i> field. The value of the date to search must be provided in the format 'YYYY-MM-DD' (ISO 8601 based date format). Optionally a syntax for comparison queries (<, ≤, >, ≥ and range) may be supported. Similar solutions should be evaluated and best practices should be used.
<b>doctype</b>	Searches for exact matches in the <i>PEPPOL document type identifier</i> field.
<b>resultPageIndex</b>	The result page to be shown. If this parameter is not present the first page is returned. The result page index is 0-based meaning that the first page has index 0. The index of the first search result returned is calculated by $resultPageIndex * resultPageCount$
<b>resultPageCount</b>	The number of results to be returned on a single page. If this parameter is not present 20 results are returned by default.

412 If multiple of the query parameters are used together only the results matching ALL query terms are  
413 returned.

### 414 6.1.2 Response

415 If no query term parameter (see table in chapter 6.1.1) is provided the return value is HTTP 400 (Bad  
416 Request).

417 Note: the PD Publisher will deliver at most the top 1000 results. If the combination of  
418 `resultPageIndex` and `resultPageCount` results in too small (< 0) or too large values (> 1000) the  
419 return value is HTTP 400 (Bad Request). The index of the first search result returned is  
420  $resultPageIndex * resultPageCount$ . The index of the last search result returned is  
421  $(resultPageIndex + 1) * resultPageCount - 1$ .

## 422 6.2 User interface

### 423 6.2.1 Use case Search

424 The PD Publisher must offer a publicly available web page where the user can enter search terms to  
425 search for one or more PEPPOL participants. It should provide a simple search form where only a set  
426 of terms can be entered and the *PD Publisher* will search for the best possible matches. Additionally  
427 an extended search form with all fields (as outlined in chapter 6.1.1) should be available.

428 The search results will be shown on the website and will also be made available for download.

### 429 6.2.2 Use case Browse

430 The *PD Publisher* should offer a list of all registered business entities so that the information is  
431 browsable or even downloadable as e.g. an Excel document. This of course implies that the full data  
432 must be stored in the *PD Indexer*.

433 This use case has slightly lower priority for implementation than the Search use case but is  
434 definitively a valuable extension.

## 435 **7 Annex A - Business Card XSD**

436 The current Business Card XML Schema can be found on GitHub:

437 [https://github.com/phax/peppol-directory/blob/master/peppol-directory-](https://github.com/phax/peppol-directory/blob/master/peppol-directory-businesscard/src/main/resources/schemas/peppol-directory-business-card-20161123.xsd)  
438 [businesscard/src/main/resources/schemas/peppol-directory-business-card-20161123.xsd](https://github.com/phax/peppol-directory/blob/master/peppol-directory-businesscard/src/main/resources/schemas/peppol-directory-business-card-20161123.xsd)

## 439 **8 Annex B - Implementation proposal (non-normative)**

440 This section roughly describes, how the *PD Server* could be implemented and how existing SMP  
441 servers could be modified to interact with the PD server.

442 All data described in this document must be stored and/or transmitted in UTF-8 character encoding  
443 set. Using other character encodings is prohibited.

444 The rest of this chapter assumes that the development will be done with Java.

### 445 **8.1 PD Server**

446 For simplicity the *PD Server* should be implemented as a regular Java web application that is runnable  
447 on a regular servlet container like Apache Tomcat or Jetty. It internally consists of two main parts:  
448 the *PD Indexer* and the *PD Publisher*. Both components have to expose a component to the outside  
449 world but need to fulfil different tasks.

#### 450 **8.1.1 PD Indexer**

451 The *PD Indexer* is responsible for gathering the business cards from the different SMPs and storing it  
452 into a searchable index. It is also responsible for periodically grabbing all participants from the SML.

453 The basic components are:

- 454 • A “work queue” that handles the requested actions for certain participants with a certain  
455 priority handling (requests from SMPs have a higher priority than SML crawling results). The  
456 work queue must be able to filter out duplicate requests and leave only the ones with the  
457 highest priority.
- 458 • A “fetcher” that grabs action items from the work queue and queries the SMP for the  
459 corresponding data of a participant
- 460 • An “indexer” that takes the fetch results and stores them into a searchable index
- 461 • A scheduled “SML retriever” that retrieves the participant list from the SML and stores all  
462 entries for updating in the work queue.
- 463 • A REST server implementing the interfaces as defined in chapter 5 and accordingly filling the  
464 work queue. Only HTTP requests providing a valid PEPPOL SMP client certificate are  
465 accepted.
- 466 • An “auditor” that keeps track of all indexing actions together with some meta information

467 The *PD Indexer* should be based on Apache Lucene (<https://lucene.apache.org/core/> - Apache 2  
468 License) for the indexing. The REST interface is to be done with Jersey (<https://jersey.java.net/> - CDDL

---

469 1.1 or GPL 2 with Classpath exception) like with the SMP. The scheduling functionality is provided by  
470 Quartz (<http://quartz-scheduler.org/> - Apache 2 License).

### 471 **8.1.2 PD Publisher**

472 A simple *PD Publisher* can be built with the ph-oton library (<https://github.com/phax/ph-oton> -  
473 Apache 2 License) which offers capabilities to create state of the art (responsive, fast, nice looking)  
474 web applications quickly. For the main searching Apache Lucene will be used (must be identical to  
475 the version used for indexing).

476 The basic components of the *PD Publisher* are:

- 477 • A REST based search interface as described in chapter 6.1
- 478 • A public web page for the simple search
- 479 • A public web page for the extended search
- 480 • A public web page with the most recently added participants
- 481 • A secure web site to see the log and audit entries

## 482 **8.2 SMP-PD interface**

483 The PD software suite should ship with a library that can be used to trigger the indexing in the *PD*  
484 *Indexer*. SMP software providers can use this library to simplify the process of integrating their  
485 software with the PD as they just need to call this when relevant information changes (new  
486 participant, Business Card update, participant deletion).

487 It is proposed to provide a patch for the CIPA SMP server  
488 (<https://joinup.ec.europa.eu/software/cipaedelivery/description>).

489 phoss SMP (<https://github.com/phax/peppol-smp-server>) already supports the new Business Card  
490 API.
